|                                               |           |
|-----------------------------------------------|-----------|
| <i>Preface</i>                                | ix        |
| <i>Foreword by Professor Runqiu Huang</i>     | xi        |
| <i>Foreword by Professor Jianbing Peng</i>    | xiii      |
| <i>Acknowledgements</i>                       | xv        |
| <i>About the Authors</i>                      | xvii      |
| <br>                                          |           |
| <b>1 Origin and spatial distribution</b>      | <b>1</b>  |
| 1.1 Introduction                              | 1         |
| 1.2 Definition of loess                       | 2         |
| 1.3 Evidence of aeolian origin of loess       | 2         |
| 1.3.1 Material composition                    | 2         |
| 1.3.2 Spatial zoning of grain size            | 5         |
| 1.3.3 Materials of the source area            | 5         |
| 1.3.4 Transport mode                          | 5         |
| 1.3.5 Process of formation and evolution      | 9         |
| 1.4 Spatial distribution                      | 9         |
| 1.4.1 Distribution of loess in the world      | 9         |
| 1.4.2 Distribution of loess in China          | 18        |
| <br>                                          |           |
| <b>2 Loess landforms</b>                      | <b>27</b> |
| 2.1 Introduction                              | 27        |
| 2.2 Platforms                                 | 27        |
| 2.3 Ridges                                    | 30        |
| 2.4 Hillocks                                  | 32        |
| 2.5 Gully                                     | 32        |
| 2.6 Secondary landforms                       | 35        |
| 2.6.1 Dish                                    | 36        |
| 2.6.2 Crater                                  | 36        |
| 2.6.3 Wall and column                         | 39        |
| 2.7 Formation and evolution of loess landform | 41        |
| <br>                                          |           |
| <b>3 Loess microstructure</b>                 | <b>45</b> |
| 3.1 Microstructural characteristics           | 45        |
| 3.1.1 Particle size and shape                 | 45        |
| 3.1.2 Occurrences of particles                | 46        |

|          |                                                |            |
|----------|------------------------------------------------|------------|
| 3.1.3    | Particle contacts                              | 48         |
| 3.1.4    | Cementation characteristics                    | 49         |
| 3.1.5    | Particle arrangements and pore characteristics | 50         |
| 3.2      | Classification of microstructure               | 54         |
| 3.3      | Particle size zoning across the loess plateau  | 54         |
| 3.4      | Microstructural characteristics under SEM      | 56         |
| 3.4.1    | Sandy loess                                    | 58         |
| 3.4.2    | Silty loess                                    | 58         |
| 3.4.3    | Clayey loess                                   | 58         |
| 3.5      | Summary                                        | 66         |
| <b>4</b> | <b>Physical and mechanical properties</b>      | <b>71</b>  |
| 4.1      | Classification of loess                        | 71         |
| 4.2      | Physical and mechanical properties             | 72         |
| 4.2.1    | Dry density                                    | 72         |
| 4.2.2    | Natural moisture content                       | 73         |
| 4.2.3    | Plasticity index                               | 74         |
| 4.2.4    | Liquidity index                                | 74         |
| 4.2.5    | Compressibility coefficient                    | 75         |
| 4.2.6    | Compressive modulus                            | 76         |
| 4.2.7    | Collapsibility coefficient                     | 77         |
| <b>5</b> | <b>Loess permeability</b>                      | <b>83</b>  |
| 5.1      | Dry density                                    | 84         |
| 5.2      | Buried depth                                   | 85         |
| 5.3      | Confining pressure                             | 87         |
| 5.4      | Permeation time                                | 88         |
| 5.5      | Freeze-thaw cycle                              | 90         |
| 5.6      | Anisotropy                                     | 92         |
| <b>6</b> | <b>Shear strength</b>                          | <b>97</b>  |
| 6.1      | Sedimentary age                                | 97         |
| 6.2      | Moisture content                               | 98         |
| 6.3      | Test methods                                   | 102        |
| 6.4      | Dry density, void ratio and compaction degree  | 104        |
| 6.5      | Shear direction                                | 106        |
| 6.5.1    | Wucheng and Early Lishi loess                  | 106        |
| 6.5.2    | Later Lishi and Malan loess                    | 108        |
| <b>7</b> | <b>Tensile strength</b>                        | <b>117</b> |
| 7.1      | Significance                                   | 117        |
| 7.2      | Tensile strength                               | 117        |
| 7.2.1    | Cohesive                                       | 117        |
| 7.2.2    | Values of tension strength                     | 118        |
| 7.3      | Influencing factors                            | 118        |
| 7.3.1    | Moisture content                               | 118        |
| 7.3.2    | Dry density                                    | 120        |

|          |                                  |            |
|----------|----------------------------------|------------|
| 7.3.6    | Test methods                     | 123        |
| <b>8</b> | <b>Loess geohazards in China</b> | <b>125</b> |
| 8.1      | Loess geohazards in China        | 125        |
| 8.2      | Shallow loess collapse           | 126        |
| 8.2.1    | Controlling factors              | 126        |
| 8.2.2    | Distribution law                 | 134        |
| 8.2.3    | Failure modes                    | 138        |
| 8.3      | Deep-seated loess landslide      | 141        |
| 8.3.1    | Controlling factors              | 142        |
| 8.3.2    | Distribution law                 | 147        |
| 8.3.3    | Failure modes                    | 151        |
|          | <i>Index</i>                     | 155        |
